

Combination of DORIS TRF

JJ. Valette¹, L. Soudarin¹, Z. Altamimi²

¹ *CLS, Collecte Localisation Satellites, Ramonville, France*

² *Institut Géographique National, Marne-La-Vallée, France*

IDS Analysis campaign

2002 Analysis Campaign

**Analysis
Software
Strategy for TRF combination**

Monthly solutions analysis

Weekly solutions analysis

Future

2002 IDS analysis campaign

Nov. 2001 : call for participation

> Times series of DORIS station network coordinates with variance-covariance (sinex file)

Jun. 2002 : Biarritz IDS workshop

> Extension of the analysis to geocenter and EOP (Zuheir A. presentation)

Oct. 2002 : Munich IERS workshop

> Sinex2.0

> Solutions including EOP

Feb. 2003 : organization of the products in the Data Center (IDS coordinator, ...)

> structure, naming convention, description file,...

2002 IDS analysis campaign : participation

Group	Team – contact	Contribution to the station coordinates analysis
IGN-JPL (France-USA)	Pascal Willis (IGN) Yoaz Bar-Sever (JPL)	Multi-satellites Weekly solutions Monthly (from 1993 until 2002) global solutions
INASAN (Russia)	Suriya Tatevian Kuzin Sergey	Multi-satellites Weekly solutions
LEGOS/CLS (France)	Jean-François Crétaux (LEGOS/GRGS) Laurent Soudarin (CLS)	Multi-satellites Monthly solutions (from 1993 until end of 2001) Global solution

For operational use only

SOD/CNES (France)	Jean-Paul Berthias Adèle Guitar	All 2002 3 days multi-satellites solution a few days delay for station network control
SSALTO/CLS-CNES (France)	Jean-Jacques Valette	Monthly/weekly multi-satellites solutions (routine process, one-txo weeks delay for station network control)

IDS analysis campaign : submitted solutions

<i>Analysis Center</i>		<i>Data Span</i>	<i>Solution*</i>	<i>Satellites</i>	<i>Constraints</i>
IGN-JPL	(IGN)	1993-2002	w/m	Spot2/3/4 Topex	Free + Projection
INASAN	(INA)	1999-2001	w	Spot2/3/4 Topex	Free
LEGOS-CLS	(LCA)	1993-2001	m	Spot2/3/4 Topex	Loose (1 m)

operational calculation within a week delay

SOD	(SOD)	June 2002	w	Spot2/3/4/5 Topex/Jason (without Jason after 15/08/2003)	Loose (1-10m)
SSALTO	(SSA)	since Jan.2001	w	Spot2/4/5 & Topex	Fixed orbit

* **w** : week, **m** : month

Several submissions

A significant effort of the participants :

- *reprocessing when remove signals*
- *better solutions*
- *few solution with very bad residuals*
- *co-variance matrix*
- *Domes number*
- *file naming*
- *additional info (which data and satellites, ...)*

CARTEF Analysis Software

IGN/LAREG software (Z. Altamimi & P. Sillard) :

- Comparison/combination of stations positions and velocities
(Helmert Transf.)
physical and statistical models
- Minimum constraint equations implemented
allowing to express the combined frame in any external frame (ITRF2000)

Combination strategy

- Minimum constraint applied equally to individual solutions
- Combination of individual solutions
- Estimation of variance factors
- Iteration as necessary

Application for:

1/ A global combination of each time series or all together (expressed in ITRF2000)1/

2/ A combination of periodic solutions (month by month for ex., only positions)

> *The objective for a DORIS technique combined product*

Monthly Solutions Analysis

Global combination of individual monthly series - Transformations

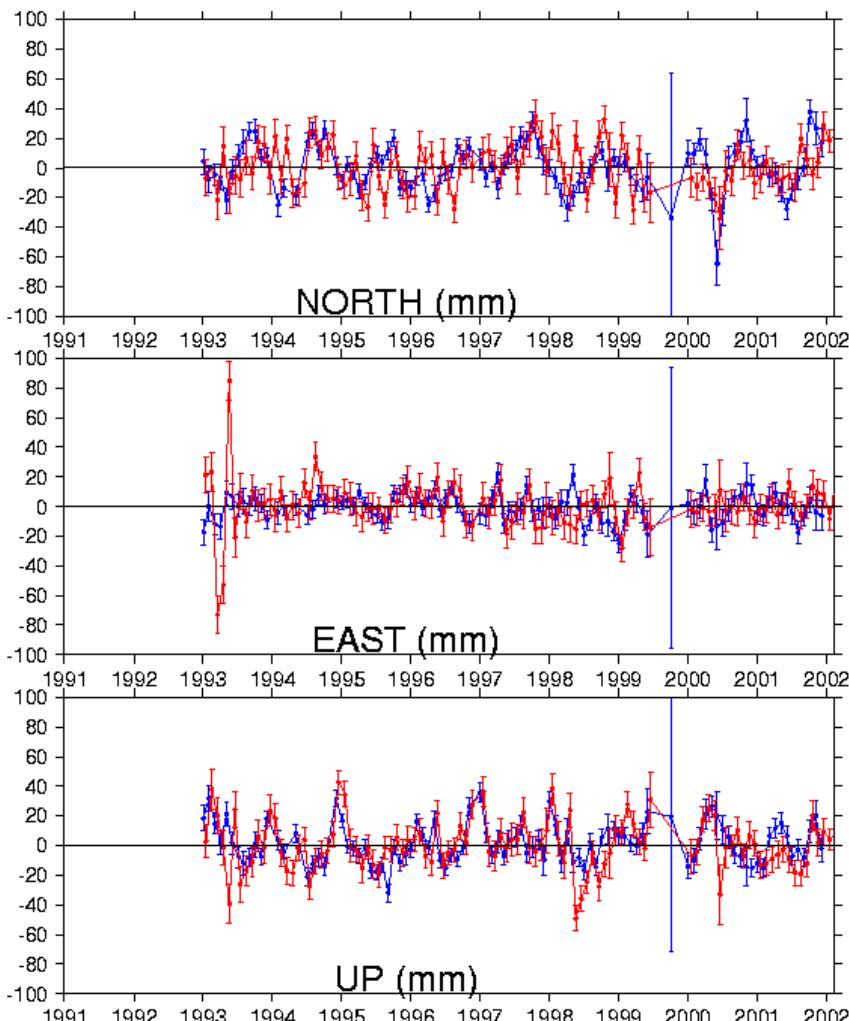

Combination of individual monthly series - WRMS

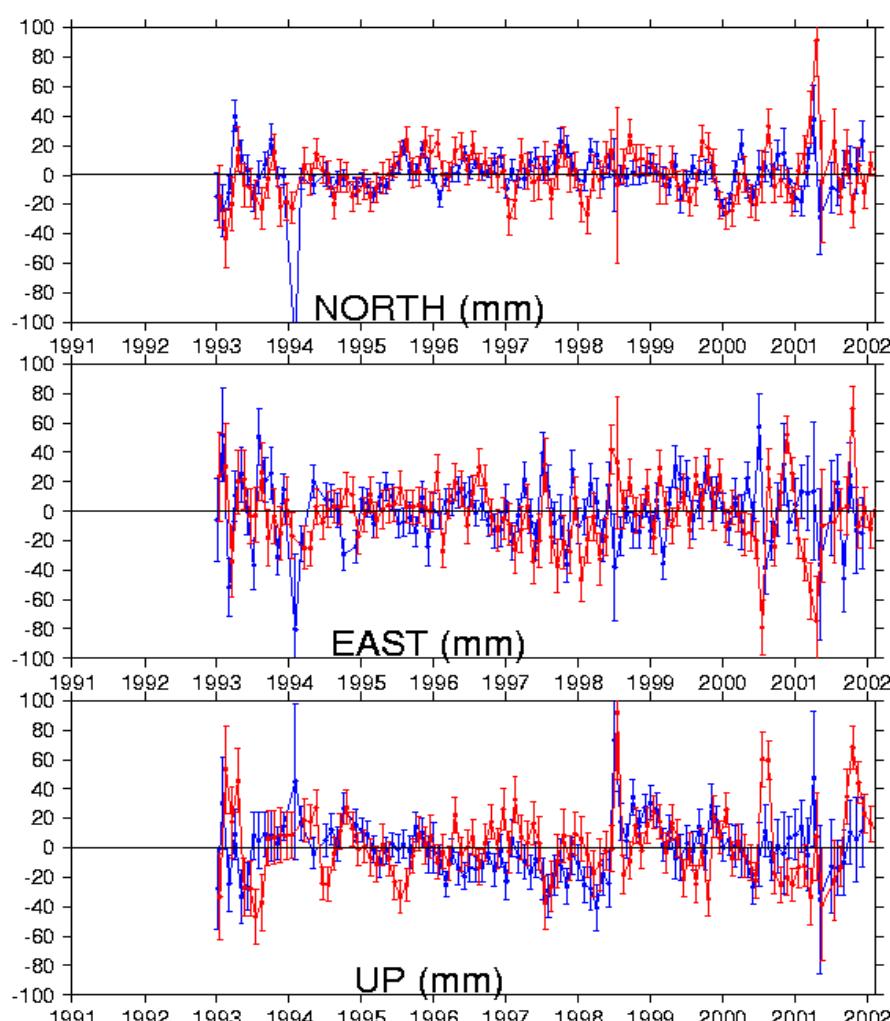

Combination of individual monthly series – Consistency

— LCA
— IGN-JPL

FAIA

DJIA

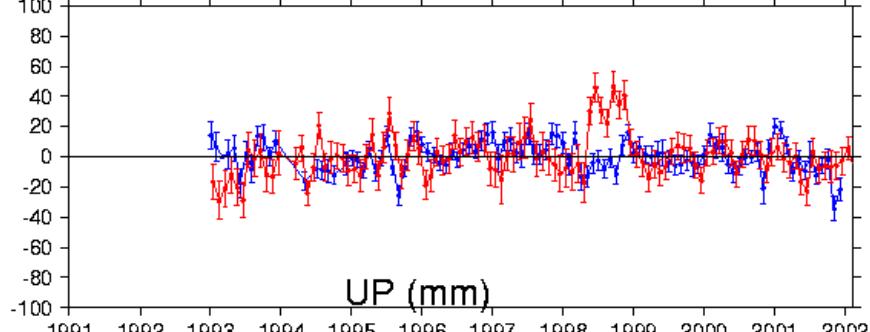

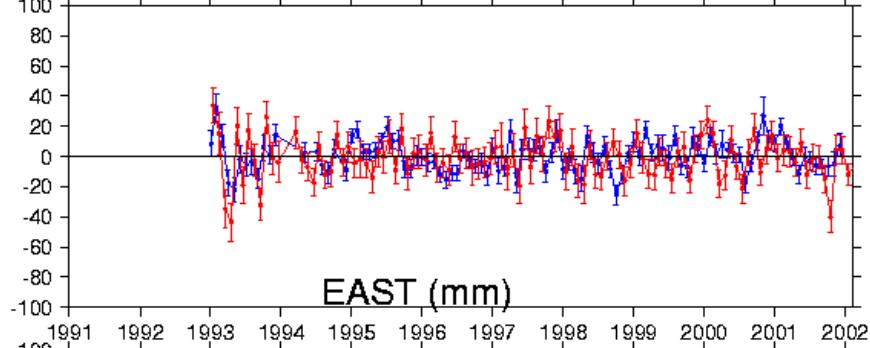

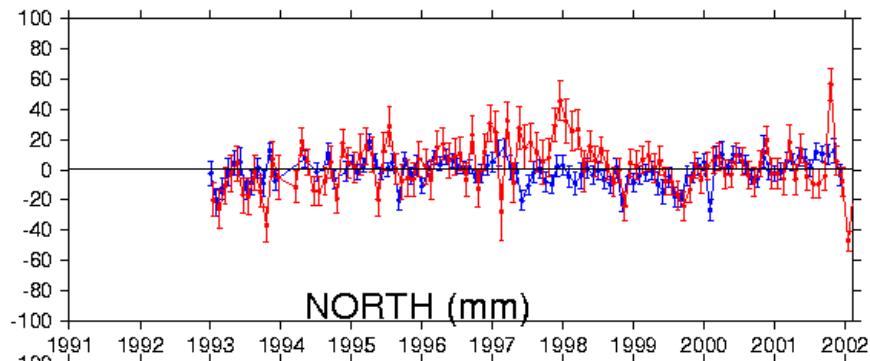

Combination of individual monthly series - *Discrepancies*

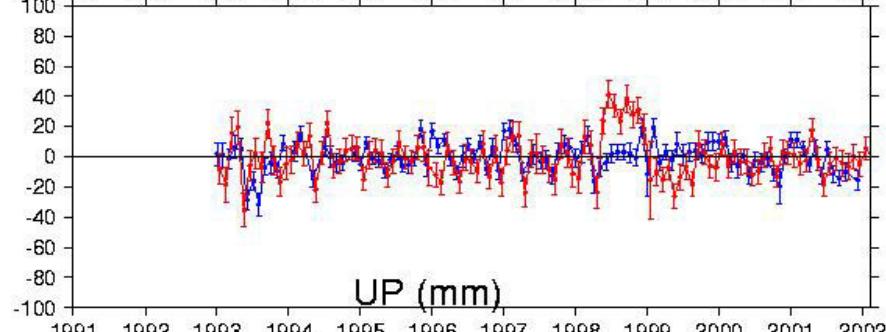

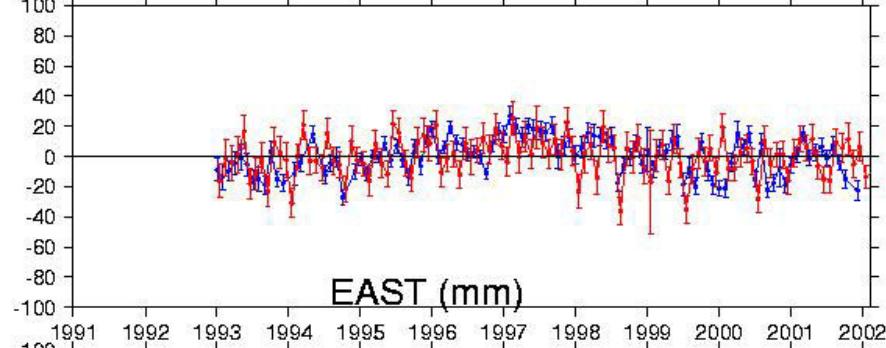

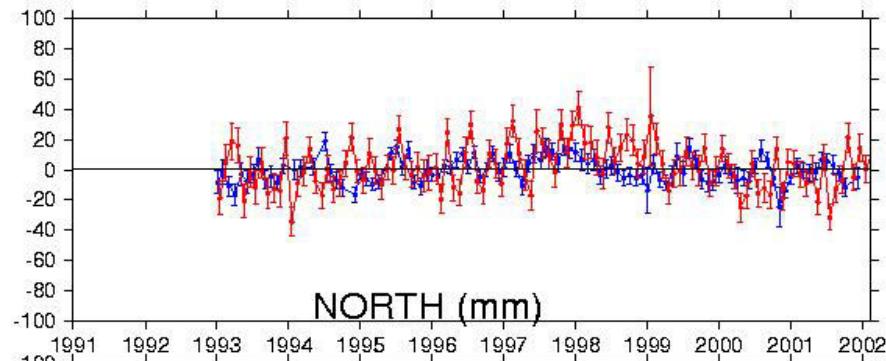

LCA

IGN-JPL

ROTA

ADEA

Month by month combination – year 2000

Only two solutions available, Reference system is arbitrary fixed with one solution
7 parameters estimation

Only the discrepancies may be observed : about 40-50 mm (2001 combination)

Worst systematic differences:

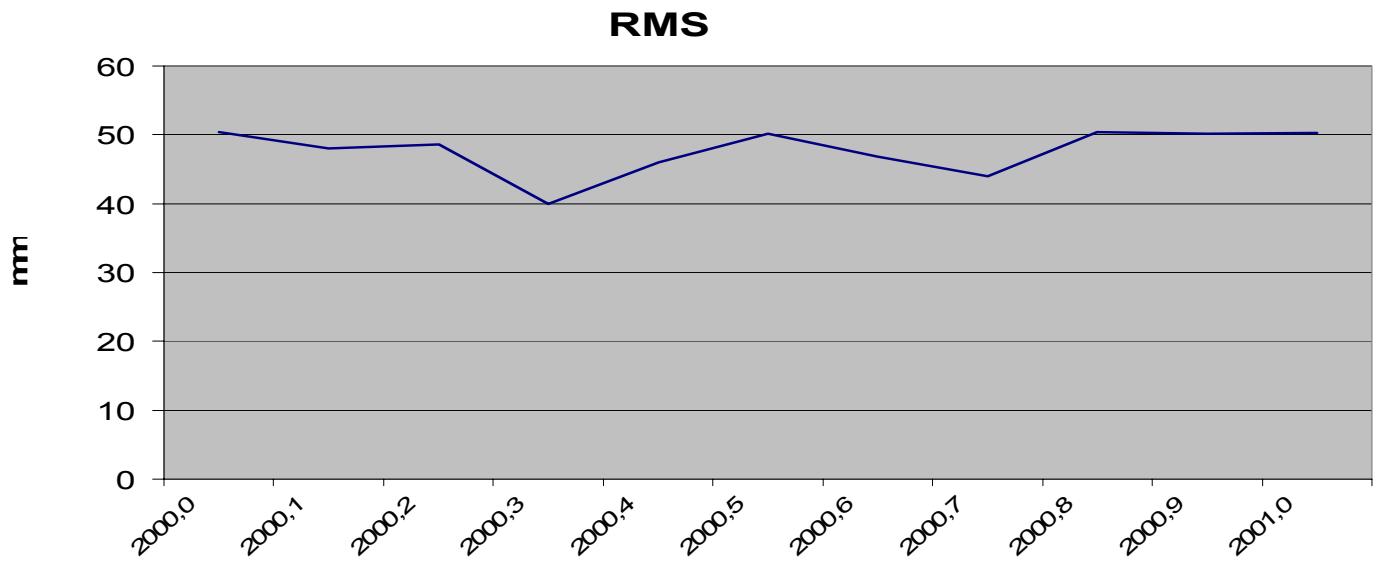

> BADA FAIB RIOB ROTA

also :

ADEA CACB GOMB

HBLA KERB KITB

KOKA ...

Monthly analysis : results

Global combination:

TX, TY about 20 mm

TZ \pm 40 mm

Most WRMS from 10-20 mm (nearly 50 stations)

Monthly combination:

More solutions for a real combination

Discrepancies of 50 mm > models investigation

LCA solutions are not estimated at the median epoch of the observations

Weekly (or near) Solutions Analysis

SSA SSALTO/CNES analysis center

2001-2002

SPOT2/3/4/5 and TOPEX

ssayydddM01.snx

No covariance matrix (apriori MOE orbit)

SOD analysis center

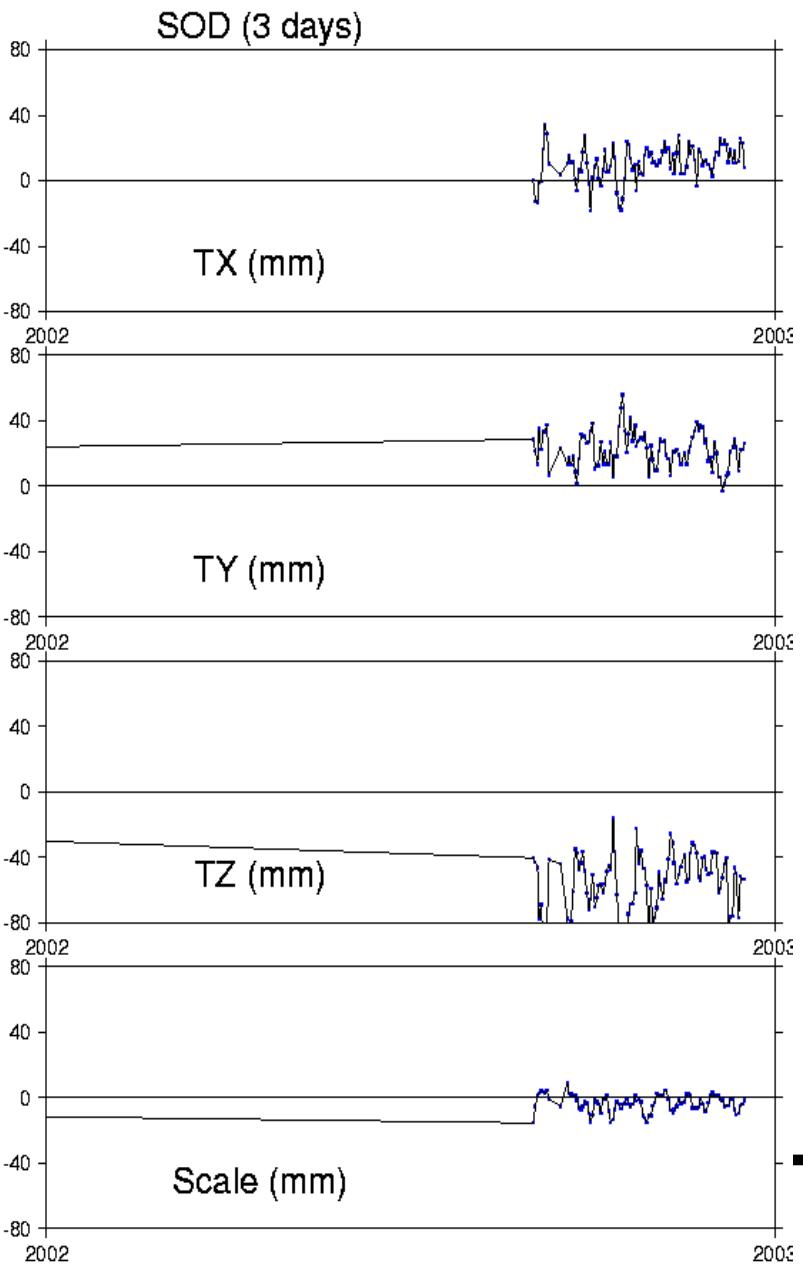

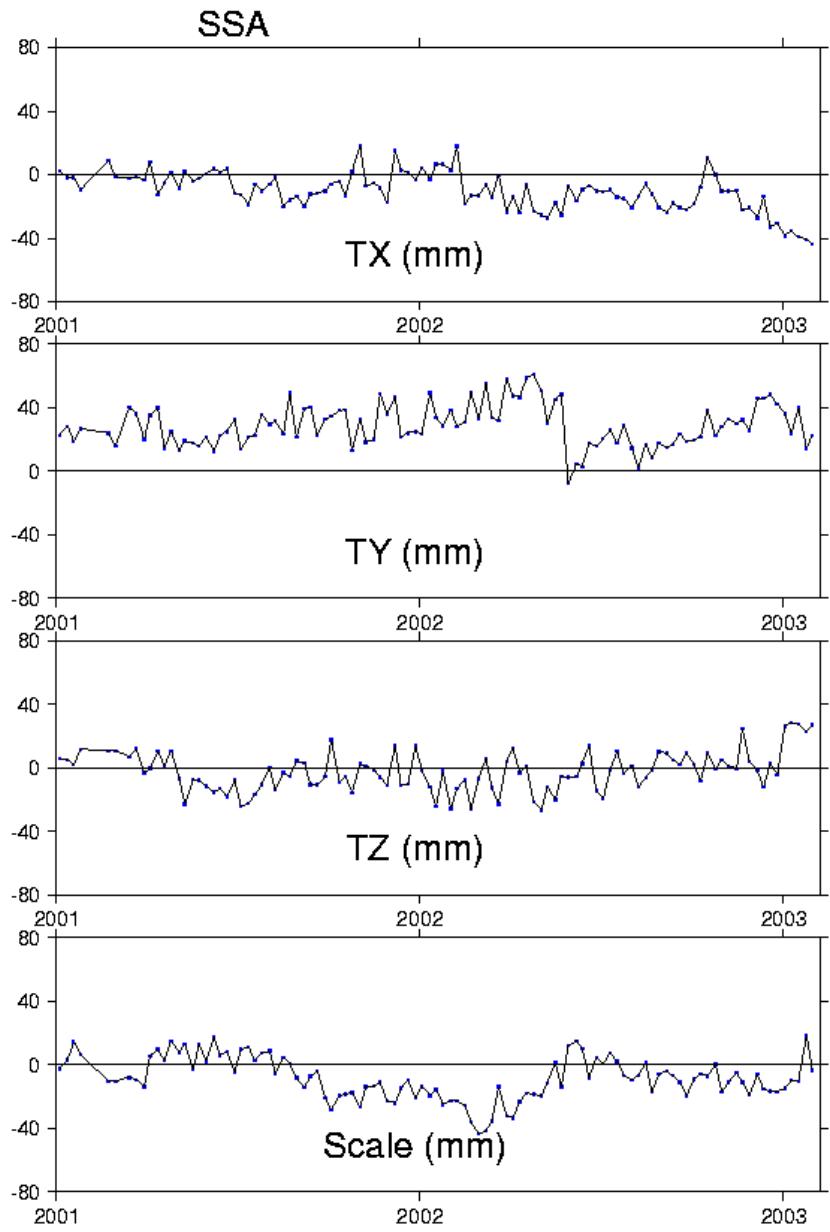

2002

3 days solutions, MOE computation

SPOT2/3/4/5, TOPEX

JASON from Jan. 2002 up to mid-Aug. 2002

Global combination of individual weekly series - Transformations

Weekly (or near) analysis : results

WRMS = 2 to 4 cm

Quick production: a few days delay

Not the best algorithms

But interested solutions for:

- *new stations,*
- *antenna position changes*
(bad weather conditions, on field erosion, earthquakes, ...),
- *network control*

Future possible products

possible products for TRF

Global solutions (positions and velocities)

*Monthly solutions 6 months delay every 2 months (INA/LCA/JPL)
+ weekly solutions ?*

Rapid weekly solutions 1-2 weeks delay once a week (SOD/SSA)

Need for identical inputs

- domes number, antenna changes
- solution periods, epoch of estimated solutions

Need for more Analysis Centers

possible new Analysis Center participation

Group	Team – contact	On-going developments
IAA-RAS (St-Petersburg)	George Krasinsky	Preliminary results of Topex/Poseidon Doppler processing Need for outputs comparisons and information about the system (satellite models,...)
Geodetic Obs. of Pecny (Czech Republic)	Petr Stepanec Jan Kostelecky	Bernese software
CSR	John Ries	Solutions for Topex & Jason
AUSLIG	Ramesh Govind	Microcosm software Solutions for Topex

DORIS training in Paris/Toulouse
